

Terraform contd

Azure virtual machine in the virtual network

- Overview
- Manual steps: refer classroom video

- The Resources which we are supposed to created are shown below in resource visualizer

Lets create a public ip address and add security group

- [Refer Here](#) for the changes done
- While creating variable we have used `list(object{})` and then we have used `count` to loop.
- `for_each` meta argument can be applied only to
 - `map`
 - set of strings
