

Creating Reusable Templates in Terraform

- Context: we need to create 2 security groups
 - web server
 - db server
- We have already written security group in template yesterday [Refer Here](#)
- We want to create a vpc with public and private subnets we have already written that as part of the template.
- I want to reuse the work to create a reusable assets that can be used by any of the projects in my org
- Terraform modules are reusable assets [Refer Here](#)
- Recommended structure for module creation

```
<module-name>
|
---- variables.tf # arguments for the module
---- main.tf      # infra
---- outputs.tf   # attributes for the module
```

- [Refer Here](#) for the vpc module
- Lets use this module in a template

Activity 1

- Create a vpc with 2 subnets by using the module
 - one public and private
- module can be called by using module block [Refer Here](#)
- [Refer Here](#) for changes

Activity 2

- Create a module for security group and create a web security group and db security group
- [Refer Here](#) for changes

Activity 3

- Using git as a module source.
- Terraform allows multiple sources for declaring modules [Refer Here](#)
 - local path
 - git or github
 - Terraform Registry

- Lets use the modules from github [Refer Here](#) for the changes done

Activity 4

- Lets create a reusable module for ec2 [Refer Here](#)
- [Refer Here](#)

Exercise

- Try creating modules for
 - virtual network
 - network security group
 - virtual machine
- As we have done for aws.
- Now use modules to create a vnet with 3 subnets (web, app ,db)
- create one security group to open 80 port only
- create 2 vms with size standard_B1s with preschool installed.

Datasources

- Datasources are used to query information from provider about resources. [Refer Here](#)
- Datasource will have arguments and attributes

lets pull information about the following in Azure

Resource groups

- we have defined the data source block

```
# lets pull information about resource groups
data "azurerm_resource_group" "query" {
  name = "ssh"
}
```

```
PS C:\khajaclassroom\devops\terraform\May24\datasources> terraform apply
data.azurerm_resource_group.query: Reading...
data.azurerm_resource_group.query: Read complete after 0s [id=/subscriptions/7ee23928-6bf0-4a1b-8e1d-b854f8f98d81/resourceGroups/ssh]

No changes. Your infrastructure matches the configuration.

Terraform has compared your real infrastructure against your configuration and found no differences, so no changes are needed.

Apply complete! Resources: 0 added, 0 changed, 0 destroyed.
PS C:\khajaclassroom\devops\terraform\May24\datasources> terraform console
> data.azurerm_resource_group.query
{
  "id" = "/subscriptions/7ee23928-6bf0-4a1b-8e1d-b854f8f98d81/resourceGroups/ssh" ✓
  "location" = "eastus" ✓
  "managed_by" = "" ✓
  "name" = "ssh" ✓
  "tags" = tomap({})
  "timeouts" = null /* object */
}
```

- syntax for using attributes fetched `data.<type>.<name>.<attribute>`

```
> data.azurerm_resource_group.query.id  
"/subscriptions/7ee23928-6bf0-4a1b-8e1d-b854f8f98d81/resourceGroups/ssh"  
>
```

Virtual machine image

- platform image [Refer Here](#)
- [Refer Here](#) for the changes done with data sources

Using Module developed by community to create virtual network in azure and vpc in aws

- Registry in terraform is used to store providers and also modules [Refer Here](#)
- [Refer Here](#) for module to create vnet
- [Refer Here](#) for module to create vpc
- [Refer Here](#) for changes

Exercise

- Create modules for azure as mentioned above
- You are asked to create vpcs in two regions You can use the module created in class. How can we use two providers one for ap-south-1 and one for oregon (us-west-2)
 - ntier-primary
 - region: mumbai
 - cidr: 10.10.0.0/16
 - public subnets: web1(10.10.0.0/24), web2 (10.10.1.0/24)
 - private subnets: db1, db2
 - ntier-secondary
 - region: oregon
 - cidr: 10.11.0.0/16
 - public subnets: web1 (10.11.0.0/24), web2 (10.11.1.0/24)
 - private subnet db2, db2
